- **Abstract:**

This project examines the financial resilience of Shoprite Holdings during periods of economic stress using annual data from 2016 to 2025. Financial and operational indicators, including revenue, operating profit, operating margin, and supermarket store footprint, were obtained from Shoprite's integrated and annual reports. These were combined with annual average share price data from Investing.com and South Africa's GDP growth rates from the World Bank to provide macroeconomic context.

The analysis shows that Shoprite consistently delivered positive revenue growth across the period, even during the 2020 recession when GDP contracted by -6.17% while revenue still increased by 4.39%. Correlation analysis reveals a very weak relationship between revenue and GDP growth ($r = 0.076$), suggesting that Shoprite's performance is largely insulated from broader economic downturns. Operating margins remained stable between 4.6% and 6.1%, with an average of 5.59%, indicating sustained profitability. In contrast, revenue shows a strong positive relationship with share price ($r = 0.784$), implying that investor confidence closely reflects financial performance. A linear regression model was used to forecast revenue for 2026, producing an estimate of ZAR 255.77 billion. Overall, the findings suggest that Shoprite's scale and necessity-based retail model contribute to its strong financial resilience during adverse economic conditions.
